

Apart from always having a clean appearance, **Stainless Steel** is a hygienic material. Its composition prevents external agents such as dust and bacteria from adhering to the surface and it is easy to clean, since its surface is non-porous.

Its durability is one of its main advantages, due to its resistance to corrosion and to the passage of time. Furthermore, it will not be degraded when exposed to cleaning products or when it comes into contact with humidity.

Due to its brilliant surface, it is often used in architecture for decorative purposes, as apart from the fact that more and more attention is now paid to the functional aspect of urban fixtures, there is an interest in giving them an attractive appearance.

Did you know... Stainless steel is not a coating, and this means its properties always remain intact.
